Experience

- **Uber** — Bangalore, India
  Senior Software Engineer (L5) — *Mar 2024 – Present*
  - **Market Efficiency (Blast Dispatch)**: Boosted completed trip volume by 1.5x and reduced cancellation rates by 10% in high-density Taxi markets by engineering a "Blast Dispatch" mechanism that broadcasts multiple driver bids simultaneously.
  - **Financial Reliability (uCommerce Migration)**: Reduced order finalization failures by 28% by leading the critical migration of settlement logic from legacy infrastructure to the uCommerce model, ensuring accurate financial reconciliation for riders, drivers, and the platform.
  - **Marketplace Metrics (NRT)**: Enabled data-driven marketplace decisions by collaborating with engineers to launch Near Real-Time (NRT) metrics at the geospatial hex level for consumer applications.
  - **Developer Productivity (Debug Monitor)**: Reduced debugging latency from 20 minutes to ∼2 seconds by mentoring interns to architect a "Debug Monitor" tool that visualizes trip lifecycle events in chronological order.
- **Uber** — Bangalore, India
  Software Engineer II (L4) — *Dec 2021 – Mar 2024*
  - **Partner Integration Scaling**: Increased completed trips by 10% by re-architecting third-party partner integrations to support multi-destination routing and real-time trip editing, enabling riders to dynamically modify active itineraries.
  - **Observability & Resilience**: Enhanced system reliability by implementing comprehensive alerting and monitoring dashboards (Grafana/M3), reducing Mean Time To Detect (MTTD) for critical production incidents by 40%.
  - **Performance Optimization**: Optimized high-throughput downstream service calls, reducing P99 latency by 150ms and improving overall system throughput during peak traffic events.
- **Flipkart** — Bangalore, India
  SDE-I — *July 2019 – Dec 2021*
  - **Kubernetes & Infrastructure**: Accelerated deployment cycles by establishing a stable pre-prod environment using Kubernetes clusters; eliminated dependency on legacy pre-prod boxes by containerizing micro-services.
  - **Anomaly Detection System**: Designed a blocking mechanism in data pipelines to detect anomalous entities, preventing business revenue loss for over 100,000+ products.
  - **Real-time Data Processing**: Engineered real-time file processing pipelines using Apache Storm topologies, enabling continuous computation with a reduced 1-minute overhead.
- **Nucleus Software** — Noida, India
  Project Intern — *May 2018 – July 2018*
  - **VoiceBot Development**: Developed a multilingual Voice Bot using RASA (ML library) with context memory to maintain conversation flow.

Education

- **National Institute of Technology** — Kurukshetra, India
  Bachelor of Technology in Computer Science; CGPA: 9.2 — *2015 – 2019*

Technical Skills

- **Languages**: Java, Python, C++, Go, SQL
- **Technologies**: MySQL, Cassandra, ElasticSearch, Kafka, Apache Flink, Kubernetes, Docker, Grafana
- **Core Concepts**: System Design (HLD/LLD), Microservices, Distributed Systems, Event-Driven Architecture
